

DBMS: Relational Algebra

Akhilesh Arya

Relational Models

- Relational model can represent as a table with columns and rows.

| Emp_Id | Name | Salary | Dept |
|--------|--------|--------|------|
| 101 | Ram | 9000 | 1 |
| 102 | Shyam | 10000 | 2 |
| 103 | Rony | 8000 | 1 |
| 104 | Shruti | 11000 | 3 |

Cont..

- **Relation:** is complete table that contains the inter-related data
- **Tuples:** the row in the relation is called as tuples
- **Attribute:** Each column in the relation is the attribute
- **Domain:** the set of all possible values that an attribute can have is the domain name
- **Degree or Arity:** total num of attributes in a relation

Example:

Attribute

Relation Employee

| Emp_Id | Name | Salary | Dept |
|--------|--------|--------|------|
| 101 | Ram | 90000 | 1 |
| 102 | Shyam | 30000 | 2 |
| 103 | Rony | 80000 | 1 |
| 104 | Shruti | 25000 | 3 |

Tuples

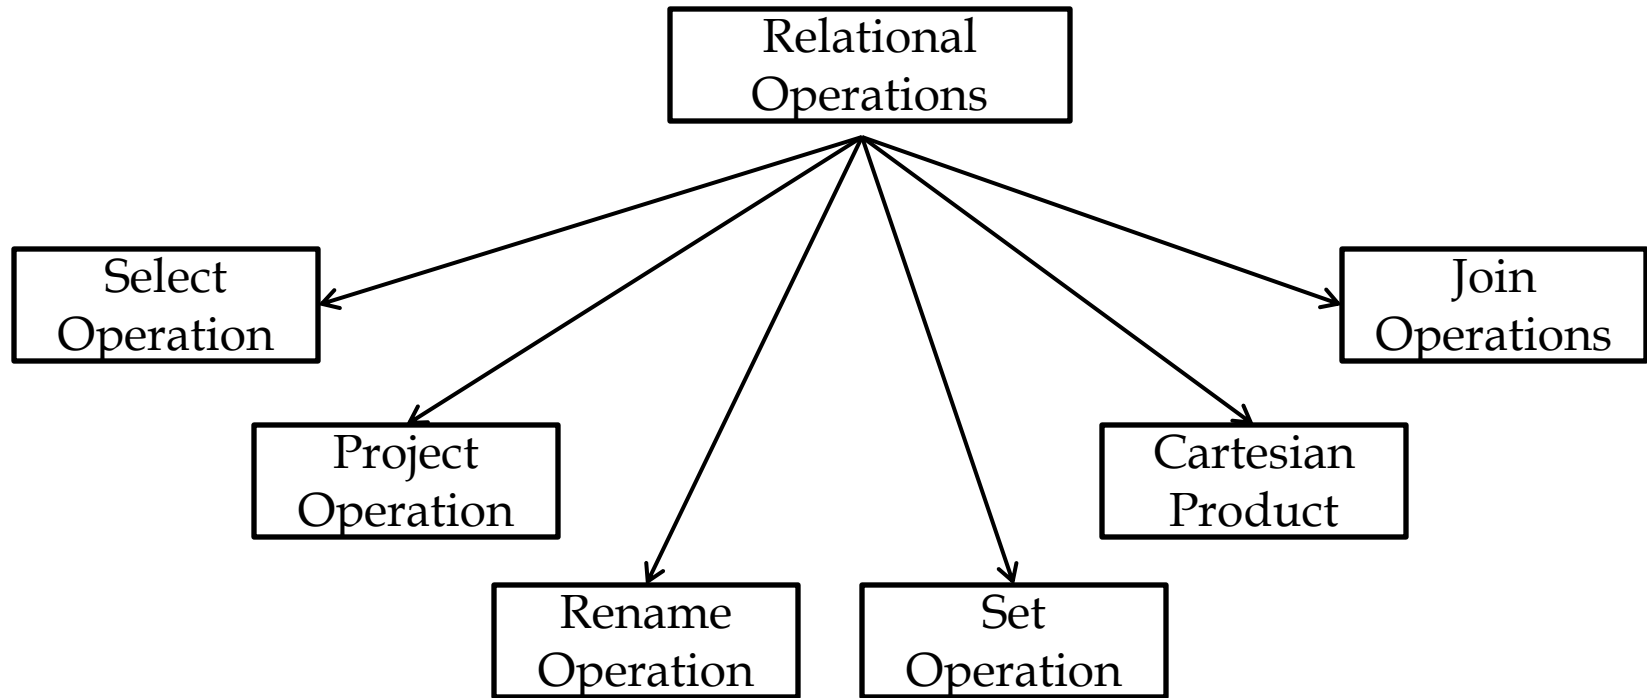

Field

Domain of Emp_Id = **All +ve num** Degree or arity = 4

Relational Algebra

- Relational algebra is a procedural query language.
- It gives a step by step process to obtain the result of the query.
- It uses operators to perform queries
 - **Boolean:** AND, OR, and NOT
 - **Relational:** $=$, \neq , \geq , $<$, $>$, \leq

Types of Relational Operators

Select Operation

- Returns all tuples which satisfy a condition
- For those tuples that do not satisfy the conditions are discarded

$$\sigma_c(R)$$

- The condition c can be $=, <, \leq, >, \geq, <>$

Employee

| Emp_Id | Name | Salary | Dept |
|--------|--------|--------|------|
| 101 | Ram | 90000 | 1 |
| 102 | Shyam | 30000 | 2 |
| 103 | Rony | 80000 | 1 |
| 104 | Shruti | 25000 | 3 |

$\sigma_{\text{Salary} > 40000}(\text{Employee})$

| Emp_Id | Name | Salary | Dept |
|--------|------|--------|------|
| 101 | Ram | 90000 | 1 |
| 103 | Rony | 80000 | 1 |

Project Operation

- The project operation selects certain columns from the table and discards the other columns.

$$\Pi_{A_1, \dots, A_n}(R)$$

Employee

| Emp_Id | Name | Salary | Dept |
|--------|--------|--------|------|
| 101 | Ram | 90000 | 1 |
| 102 | Shyam | 30000 | 2 |
| 103 | Rony | 80000 | 1 |
| 104 | Shruti | 25000 | 3 |

$\Pi_{\text{Emp_Id, Name}}$ (Employee)

| Emp_Id | Name |
|--------|--------|
| 101 | Ram |
| 102 | Shyam |
| 103 | Rony |
| 104 | Shruti |

Renaming Operation

- The resultant relation obtained from any relation algebra does not have any name
- The rename (ρ) operator is used to assign names to such relations.

$$\rho_{\text{Emp}}(\text{Employee})$$

- Now we can refer Employee relation with its new name Emp.

Set Operation

- UNION Operation
 - Will combine tuples of two union compatible relations
 - It eliminates duplicate elements and include tuple which are either in R1 or in R2

$R1 \cup R2$

| Emp_Id | Name | Salary | Dept |
|--------|--------|--------|------|
| 101 | Ram | 90000 | 1 |
| 102 | Shyam | 30000 | 2 |
| 103 | Rony | 80000 | 1 |
| 104 | Shruti | 25000 | 3 |

Employee Relation

$$\sigma_{\text{Salary} > 25000}(\text{Employee}) \cup \sigma_{\text{Dept} = 1}(\text{Employee})$$

| Emp_Id | Name | Salary | Dept |
|--------|-------|--------|------|
| 101 | Ram | 90000 | 1 |
| 102 | Shyam | 30000 | 2 |
| 103 | Rony | 80000 | 1 |

$\sigma_{\text{Salary} > 25000}(\text{Employee})$

| Emp_Id | Name | Salary | Dept |
|--------|------|--------|------|
| 101 | Ram | 90000 | 1 |
| 103 | Rony | 80000 | 1 |

$\sigma_{\text{Dept} = 1}(\text{Employee})$

$$\sigma_{\text{Salary} > 25000} (\text{Employee}) \cup \sigma_{\text{Dept} = 1} (\text{Employee})$$

| Emp_Id | Name | Salary | Dept |
|--------|-------|--------|------|
| 101 | Ram | 90000 | 1 |
| 102 | Shyam | 30000 | 2 |
| 103 | Rony | 80000 | 1 |

Cont..

- Set Intersection
 - Will combine tuples of two set intersection compatible relations
 - It combines only common tuples from R1 and R2

$$\mathbf{R1 \cap R2}$$

| Emp_Id | Name | Salary | Dept |
|--------|--------|--------|------|
| 101 | Ram | 90000 | 1 |
| 102 | Shyam | 30000 | 2 |
| 103 | Rony | 80000 | 1 |
| 104 | Shruti | 25000 | 3 |

Employee Relation

$$\sigma_{\text{Salary} > 25000}(\text{Employee}) \cap \sigma_{\text{Dept} = 1}(\text{Employee})$$

| Emp_Id | Name | Salary | Dept |
|--------|-------|--------|------|
| 101 | Ram | 90000 | 1 |
| 102 | Shyam | 30000 | 2 |
| 103 | Rony | 80000 | 1 |

$\sigma_{\text{Salary} > 25000}$ (Employee)

| Emp_Id | Name | Salary | Dept |
|--------|------|--------|------|
| 101 | Ram | 90000 | 1 |
| 103 | Rony | 80000 | 1 |

$\sigma_{\text{Dept} = 1}$ (Employee)

$$\sigma_{\text{Salary} > 25000}(\text{Employee}) \cap \sigma_{\text{Dept} = 1}(\text{Employee})$$

| Emp_Id | Name | Salary | Dept |
|--------|------|--------|------|
| 101 | Ram | 90000 | 1 |
| 103 | Rony | 80000 | 1 |

Cont..

- Set Difference

- Will combine tuples of two set difference compatible relations
- It allow us to find tuples that are in one relation but are not in another relation

$$\mathbf{R1 - R2}$$

- The set difference operation contains all tuples that are in R1 but not in R2.

| Emp_Id | Name | Salary | Dept |
|--------|--------|--------|------|
| 101 | Ram | 90000 | 1 |
| 102 | Shyam | 30000 | 2 |
| 103 | Rony | 80000 | 1 |
| 104 | Shruti | 25000 | 3 |

Employee Relation

$$\sigma_{\text{Salary} > 25000}(\text{Employee}) - \sigma_{\text{Dept} = 1}(\text{Employee})$$

| Emp_Id | Name | Salary | Dept |
|--------|-------|--------|------|
| 101 | Ram | 90000 | 1 |
| 102 | Shyam | 30000 | 2 |
| 103 | Rony | 80000 | 1 |

$\sigma_{\text{Salary} > 25000}(\text{Employee})$

| Emp_Id | Name | Salary | Dept |
|--------|------|--------|------|
| 101 | Ram | 90000 | 1 |
| 103 | Rony | 80000 | 1 |

$\sigma_{\text{Dept} = 1}(\text{Employee})$

$$\sigma_{\text{Salary} > 25000}(\text{Employee}) - \sigma_{\text{Dept} = 1}(\text{Employee})$$

| Emp_Id | Name | Salary | Dept |
|--------|-------|--------|------|
| 102 | Shyam | 30000 | 2 |

Cartesian Product

- The cartesian product allows us to combine tuples from 2 relations in combinational fashion

$$R1 \times R2$$

- If the arity of R1 is 'n' and arity of R2 is m then arity of $R1 \times R2$ will be 'n+m'
- If R1 has n_{r1} tuples and R2 has n_{r2} tuples then $R1 \times R2$ will have $n_{r1} * n_{r2}$ tuples

| Emp_Id | Name |
|--------|--------|
| 103 | Rony |
| 104 | Shruti |

Employee

| Dept No. | Dname |
|----------|-------------|
| 203 | Computer |
| 204 | Electronics |

Department

Employee X Department

| Emp_Id | Name | Dept No. | Dname |
|--------|--------|----------|-------------|
| 103 | Rony | 203 | Computer |
| 103 | Rony | 204 | Electronics |
| 104 | Shruti | 203 | Computer |
| 104 | Shruti | 204 | Electronics |

Join Operations

- Join operation can combine **cartesion** product and **selection condition** in a single operation.
- Join contains less number of tuples in comparison to cartesion product.

Conditional Join (Theta)

- It accept two relation and a condition and creates a new relation having tuples who are satisfying that condition

$$R1 \bowtie_c R2$$

- This is equivalent to

$$\sigma_c (R1 \times R2)$$

Equi Join

- Equi join case is a special case of conditional join where only condition of equality is used on the specific fields

Employee ⋈_{employee.deptno=department.deptno} Department

Natural Join

- Natural join is a special case of equi-join.
- Condition is checked on all the fields having the same name in two relations being joined

$$R1 \bowtie R2$$

Natural Join

| Emp_Id | Name | P_Id |
|--------|--------|------|
| 103 | Rony | 5 |
| 104 | Shruti | 6 |
| 105 | Amit | Null |

| P_Id | Pname |
|------|-------|
| 4 | P1 |
| 5 | P2 |
| 6 | P3 |

Employee ⋈ Project

| Emp_Id | Name | P_Id | Pname |
|--------|--------|------|-------|
| 103 | Rony | 5 | P2 |
| 104 | Shruti | 6 | P3 |

Division Operator

- Division operator is useful in the queries that include the phrases like “for all” or “every”

$$R1 \div R2$$

- Consider two instances A and B
- A has exactly 2 fields X and Y
- B has only one field that is Y with the same domain as in A
- Result of A/B will contain all the X values such that for every Y value in B, there is a tuple $\langle x, y \rangle$ in A.

| EmpId | DeptNo |
|-------|--------|
| 1976 | 1 |
| 1976 | 4 |
| 1976 | 3 |
| 1283 | 4 |
| 1283 | 3 |
| 2211 | 3 |

| DeptNo |
|--------|
| 1 |
| 3 |
| 4 |

Result of A/B?

Outer Join

- Outer join deals with the missing values in the instance
- There are three types of Outer Join
 - Left Outer Join
 - Right Outer Join
 - Full Outer Join

Left Outer Join

| Emp_Id | Name | P_Id |
|--------|--------|------|
| 103 | Rony | 5 |
| 104 | Shruti | 6 |
| 105 | Amit | Null |

| P_Id | Name |
|------|------|
| 4 | P1 |
| 5 | P2 |
| 6 | P3 |

Employee ⋈ Project

| Emp_Id | Name | P_Id | Name |
|--------|--------|------|------|
| 103 | Rony | 5 | P2 |
| 104 | Shruti | 6 | P3 |
| 105 | Amit | Null | Null |

Right Outer Join

| Emp_Id | Name | P_Id |
|--------|--------|------|
| 103 | Rony | 5 |
| 104 | Shruti | 6 |
| 105 | Amit | Null |

| P_Id | Name |
|------|------|
| 4 | P1 |
| 5 | P2 |
| 6 | P3 |

Employee ⋈ Project

| Emp_Id | Name | P_Id | Name |
|--------|--------|------|------|
| 103 | Rony | 5 | P2 |
| 104 | Shruti | 6 | P3 |
| Null | Null | 4 | P1 |

Full Outer Join

| Emp_Id | Name | P_Id |
|--------|--------|------|
| 103 | Rony | 5 |
| 104 | Shruti | 6 |
| 105 | Amit | Null |

| P_Id | Name |
|------|------|
| 4 | P1 |
| 5 | P2 |
| 6 | P3 |

Employee \bowtie Project

| Emp_Id | Name | P_Id | Name |
|--------|--------|------|------|
| 103 | Rony | 5 | P2 |
| 104 | Shruti | 6 | P3 |
| 105 | Amit | Null | Null |
| Null | Null | 4 | P1 |
